

Defining Drill-through URL

Make sure to get familiar with applying **Drill-downs** before proceeding with this section.

Drill-through via attribute members

BellaDati allows you to mask attribute's member with custom URLs. This feature is useful to:

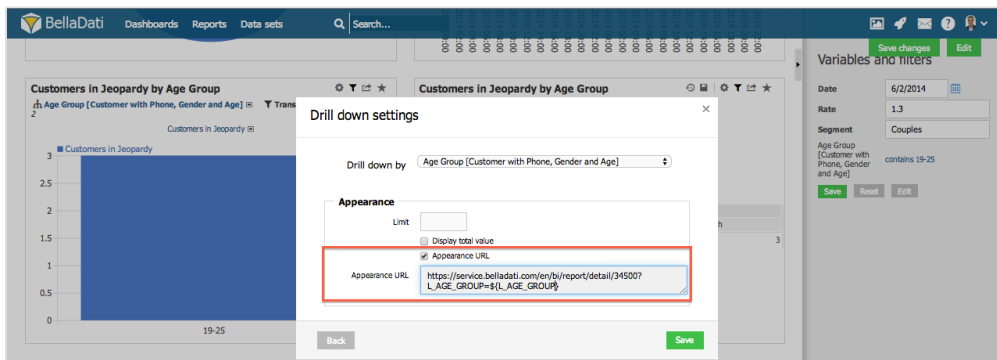

- create **Drill-throughs** - redirection from master report to detailed one based on clicked member.
- redirect to other report or resources.

Masking members

1. Open drill-down settings
 - a. In tables: Go to **Table settings** and click on existing attribute or select **Add drill-down path**.
 - b. In charts: Go to **Chart settings** and click on **Drill down path**. In charts with a drill-down on the X/Y axis, click **Advanced settings**.
 - c. In maps: Go to Map settings, click **Drill-down and map properties**.
2. Check **Show as URL link**
3. Define custom **URL**

- In the URL, you can refer to the current drill-down value using `${}`.
- To refer to other drill-down attribute values, use `${L_ATTRIBUTE_CODE}`.
- When the current drill-down values or attribute values contain special characters, such as `/`, `?` or `=`, it is necessary to decode the URL by using `${decode(${})}` or `${decode(${L_ATTRIBUTE_CODE})}`.
- It is also possible to reference an attribute member which is not present in the view by using `${firstValue(L_ATTRIBUTE_CODE)}` or `${lastValue(L_ATTRIBUTE_CODE)}`.
- You can create report links using `${reportLink(report_id)}`

Drill-through via indicator

BellaDati allows you to mask indicators with custom URLs. This feature is useful to:

- create **Drill-throughs** - redirection from master report to detailed one based on clicked indicator.
- redirect to other report or resources.

Masking members

1. Go to indicator settings
2. Select tab **Advanced settings**
3. Check **Show as URL link**
4. Define custom **URL**

- You can create report links using `${reportLink(report_id)}`
- To refer to current indicator, use `${indicatorCode}`
