

BellaDati 2.7.10.0.4

Release notes BellaDati 2.7.10.0.4

Release date: October 15, 2014

New Features

- Report - add support for changing the date/time attribute in date/time context
- Report - add function for getting current indicator value when creating condition formula
- REST API - new service to get userID from username
- REST API - domain_id is included in user JSON object

Improvements

- Attribute Filter - Domain admin is not impacted by the filter settings
- GEO mappers - updated alternate name values for US States
- Report - improved placing of elements on calculated indicator window
- Import settings - unmapped columns are indicated
- Import templates - indicate which columns have transformation script applied to them
- Report - Tables - allow to optionally display total row even there is one drill down only
- REST API - unified timeZone, locale and language in all endpoints

Bug fixes

- Android App - Dashboards of some users throws Server request failed
- PNG export - missing conditional formatting symbols
- Backup/Restore - Formula ID is not copied
- Unable to mouse over import details overflow box in IE8 on W7
- User locale settings is not effective when logging-in in a new browser
- Report - Gantt chart does not show any data
- Charts - Gantt chart does not display a task which starts in one month and ends in another one
- Report - chart is not loaded with NaN or Infinite values
- Report - row content is not displayed
- Report - adding attribute after date/time causes table render to fail
- Report - adding aggregation to group indicators causes displaying of bad values
- Table condition window - bad alignment of the fields
